

NOVEL COMPOSITIONS FOR USE IN
BATTERIES, CAPACITORS, FUEL CELLS AND
SIMILAR DEVICES AND FOR HYDROGEN PRODUCTION

5

ABSTRACT

This invention provides novel chemical compositions, for use as electrode and electrolyte materials and for hydrogen production, methods for making these compositions, and methods of using these compositions in a variety of applications. The new compositions of the present invention comprise: one or more transition metal compounds; aluminum; and either at least one soluble base or at least one soluble electrolyte in contact with the aluminum. The present invention may also comprise one or more elements and/or compounds having high mobility values for electrons, in some applications. This composition is useful as novel electrode/electrolyte components in devices such as batteries, capacitors, fuel cells and similar devices, and also useful in the direct production of hydrogen gas.
